Occupational therapy in the prevention and management of falls in adults

Practice guideline

Royal College of Occupational Therapists

Quick Reference and Implementation Guide
Occupational therapy in the prevention and management of falls in adults

Quick Reference and Implementation Guide

This guide provides a summary of the recommendations in the Royal College of Occupational Therapists practice guideline *Occupational therapy in the prevention and management of falls in adults* and suggestions for implementing the recommendations.

It is intended to be used by practitioners as an easily accessible reminder of the recommendations for intervention and implementation. It should be used once the practitioner has read the full guideline document. This is important to ensure an appreciation and understanding of how the recommendations were developed and their context.

The full practice guideline together with implementation resources can be found on the Royal College of Occupational Therapists website:

https://www.rcot.co.uk/practice-resources/rcot-practice-guidelines
Introduction

The objective of this practice guideline is to provide evidence-based recommendations that inform occupational therapists, working with adults who have fallen, are at risk of falling or are fearful of falling, of their role within the multifactorial assessment and intervention required to prevent and manage falls. The recommendations are intended to be used alongside the therapist’s clinical expertise in their assessment of need and implementation of interventions. The occupational therapist is, therefore, ultimately responsible for the interpretation of the evidence-based guideline in the context of their specific circumstances and service users.

It is intended that occupational therapists use this guideline to inform their work with service users, with a particular focus on empowering the service user to fully engage and take responsibility for achieving individual goals. It should furthermore inform work with carers and people who support adults who have fallen or are at risk of falls. This may be particularly pertinent when the service user has a cognitive impairment. The application of this guideline will also inform the commissioning and delivery of evidence-based services.

This resource provides a quick reference to the guideline recommendations, together with tables outlining the nature of the strength and quality grading categories of the recommendations. Extracts from the full guideline document on the background to the clinical condition and an overview of the occupational therapy role are also provided. Evidence-based recommendations are, however, not intended to be taken in isolation and must be considered in conjunction with the contextual information and full guideline development methodology, described in the practice guideline document, together with current versions of professional practice documents, of which knowledge and adherence is assumed (COT 2015, p10).

Additionally, this resource provides tips for implementing the guideline’s recommendations, acting as an aid to occupational therapists wishing to incorporate the knowledge and evidence base contained in the guideline into their practice.

1. Background to clinical condition

Falls may occur at any age, but the combination of risk factors means that whilst falls are not an inevitable part of ageing, they are more likely to occur with increasing age.

A key stage of any falls pathway for older people is to identify those who may be at risk of falling. Guidance within all four countries of the UK recommend that older people who are in contact with healthcare professionals should be asked about falls experienced in the previous year and, if relevant, the frequency, context and characteristics of those falls (DHSSPNI 2013, NHS Quality Improvement Scotland 2010, NICE 2013).

The interpretation of the evidence base for falls risk factors is often confounded due to the variety of study designs employed and heterogeneity of the older population. Studies have, however, identified some people who are at higher risk of falls, including people with dementia, people with learning disabilities and older people with sight loss.

Although most falls do not result in serious injury, the negative outcomes of a fall are considerable and can include: ‘psychological problems (for example, a fear of falling and loss of confidence in being able to move about safely); loss of mobility, leading to social isolation and depression; increase in dependency and disability; hypothermia; pressure-related injury and infection’ (NICE 2013, p26). The costs of rehabilitation and social care are great, with up to 90% of older patients who fracture their neck of femur while hospitalised failing to recover their previous level of mobility or independence (Murray et al 2007).

The importance of a comprehensive multifactorial falls risk assessment to identify the factors pertinent for an individual must be emphasised. NICE recommends that older people should be offered such an assessment if they present for medical attention because of a fall, if they report recurrent falls in the past year, or if they demonstrate abnormalities of gait and/or balance (NICE 2013).
2. The occupational therapy role

Occupational therapy intervention with adults who have fallen, are at risk of falling or who are fearful of falling occurs in a wide range of settings in health, social care, voluntary and independent sectors, including hospitals, people's own homes, care homes, day centres and prisons.

The person-centred and holistic philosophy of occupational therapy underpins the recommendations within this guideline. The purpose of occupational therapy is to enable people to fulfil, or to work towards fulfilling, their needs and wishes in their lives. Occupational therapy provides practical support to enable people to overcome any barriers that prevent them from doing the activities (occupations) that matter to them. This helps to increase people's independence and maintain their dignity and satisfaction in all aspects of life. 'Occupation' refers to practical and meaningful activities that allow people to achieve their wishes and meet their needs. This could be essential day-to-day tasks such as getting dressed, work related activities, or leisure and hobbies.

Clinical reasoning must take account of individual preferences and needs, including the complexities of treating people with multiple pathologies and people with cognitive or emotional disorders, dementia and learning disabilities.

Occupational therapists consider the person, their environment and their occupation (Law et al 1996). These three domains have an alignment with the risk factor categories for falls: intrinsic (person), extrinsic (environment) and behavioural (occupation). Embracing the three means that occupational therapy falls prevention and management intervention maximises the potential to impact positively on an individual's ability to carry out daily activities (‘occupational performance’).

The occupational therapy role in falls prevention and management may include, but is not necessarily limited to, the key areas described in the sections below:

**Identification of those at risk**
Identifying those at risk is in line with NICE Clinical Guideline 161 which states that ‘older people in contact with healthcare professionals should be asked routinely whether they have fallen in the past year and asked about the frequency, context and characteristics of the fall/s’ (NICE 2013, p11).

Falls, osteoporosis and osteoporotic fractures are inextricably linked, and occupational therapists should therefore be aware of higher-risk groups, the importance of diet, medication and (bone loading) physical activity, applying, as appropriate, any associated clinical guidance (NICE 2012, SIGN 2015).

NICE identifies ‘older people’ as those aged 65 and over, but in the case of hospital admissions also includes people aged 50-64 years who are deemed at risk of falling due to an underlying condition. Occupational therapists work with adults of all ages who may be at risk or fearful of falling in a variety of settings, such as people living with Parkinson's who are at increased risk of falling due to postural instability, impaired balance, reduced saving reactions, visuospatial disturbances and difficulties with tasking (Aragon and Kings 2018, p51); people who have had lower limb amputations (COT 2011); and people undergoing total hip replacement (RCOT 2017). The occupational therapist, therefore, needs to be able to identify an individual's risk factors for falls, including those factors that can and cannot be modified.

**Assessment of performance and function**
Occupational therapists contribute to a number of the elements of a multifactorial assessment, notably with respect to the ‘assessment of perceived functional ability and fear relating to falling’, and ‘assessment of home hazards’ (NICE 2013, p13).

Assessment includes an individual’s ability to perform activities of daily living that they need or wish to perform independently and safely (e.g. getting dressed, cooking a meal, walking outside), roles (e.g. returning to work, caring for another person), social and psychological considerations, cognition, fear and confidence, and mental capacity.
**Interventions and treatment plans**

Interventions include positive risk-taking in activity, maximising functional performance, improving self-confidence and social engagement. Environmental advice and modification to reduce home hazards, education and practice in safe moving and handling, with provision of equipment as required, are also appropriate. All interventions should promote independence and personal safety. Reablement, where indicated, will involve working with support workers to resume activities of daily living and occupational roles (Social Care Institute for Excellence [SCIE] and COT 2011).

Occupational therapy intervention for falls may be in the context of condition management strategies. A pilot study in Australia examined the potential for the inclusion of occupational therapy and physiotherapy services within chronic disease management plans in the primary care setting; results demonstrated encouraging outcomes for reducing falls risk (Mackenzie and Clemson 2014).

**Self-management strategies**

Falls prevention education and information for service users should be congruent with the NICE clinical guideline (NICE 2013). Information should include actions or behaviours the service user can utilise to prevent further falls; how to stay motivated if referred for falls prevention intervention that includes exercise or strength and balancing components; the preventable nature of some falls; the physical and psychological benefits of modifying falls risk; and where to seek further advice. Where a service user requires assistance to implement self-management strategies (e.g. as a consequence of a poor level of risk awareness due to cognitive impairment or learning disability), there is a role for occupational therapists in supporting the person’s carers and family. Occupational therapists have a key role in signposting to falls prevention advice and support available locally and nationally.

Contingency planning for the management of future falls which may occur should be explored. This may include advice and practice, where appropriate, on how to summon help and how to avoid the consequences of a ‘long lie’. Occupational therapists should help the service user to identify behaviours which may increase the risk of falls and assist with behaviour change to reduce those risks.

Telecare (technology such as a pendant alarm to summon assistance, or remote monitoring via items such as a falls detector) is an option which may be explored in the context of self-management. The evidence remains mixed with regard to telecare outcomes and cost-effectiveness (Henderson et al 2013, Steventon et al 2013). Qualitative studies have identified that when sensitively tailored to the needs of the individual, telecare has the potential to increase confidence and reduce fear of falling (Horton 2008, Stewart et al 2012). The use of technology is likely to be influenced by intrinsic factors associated with an individual’s attitude, choice, control, independence and perceived need for safety measures (Hawley-Hague et al 2014).

**Outcome measures**

Occupational therapists working in partnership with people who fall, are at risk of falling or are fearful of falling should evaluate the effectiveness of their intervention. This means ensuring that appropriate standardised assessment tools are used as a baseline from which change can be measured, seeking the views of individuals and carers regarding the effectiveness of the intervention, and documenting the process and results of assessments and interventions. Records and outcome measures should be used to ensure that progress is made towards the agreed goals and objectives (COT 2013a).

The Royal College of Occupational Therapists Specialist Section-Older People Falls Clinical Forum provides an opportunity for occupational therapists to review and discuss current evidence and practice in relation to standardised assessments for falls.

**Staff education and training**

Occupational therapists provide a crucial contribution to the education and training of other staff working in falls prevention, and support the delivery of the NICE recommendation that ‘all healthcare professionals dealing with patients known to be at risk of falling should develop and maintain basic professional competence in falls assessment and prevention’ (NICE 2013a, p16). In addition to traditional health care settings, the occupational therapist has an important role in working with and training staff in care homes (COT 2013b), and care workers delivering home care services and reablement (SCIE and COT 2011).
Improving health and wellbeing
Improving health, wellbeing and independence, including reducing falls, has been highlighted as a priority for healthcare professionals (Public Health England 2018). It is important, therefore, to note that it is being increasingly recognised that allied health professionals ‘have the potential to add to virtually every public health priority’ (Hindle 2014). Public health guidance also identifies that occupational therapists have a valuable contribution in promoting mental wellbeing through physical activity interventions (NICE 2008). The public health guidance complements and supports the falls guideline (NICE 2013) and occupational therapists should therefore explore and support opportunities for service users to participate in appropriate physical activity. Occupational therapists should also take into account potential health inequalities and any social determinants of health, which may be appropriate to the provision of services. In falls prevention and management, this can be addressed specifically through maximising individual capacity and control over life and strengthening the role and impact of ill health prevention (Marmot 2010, p15).

Multidisciplinary working
The multifactorial nature of falls prevention and management strategies means that working as an effective team member is vital. It is recognised that as part of a multidisciplinary team, there may be some key areas of assessment and intervention that overlap with the role of other health and social care personnel. Where an occupational therapist is unable to provide the required intervention, the service user should be referred to an appropriate service to meet his or her needs.

Occupational therapy staff must work alongside other professionals in accordance with local service arrangements, to ensure the needs of the service user are met. Good communication across the primary and secondary care interface, and between health, social care, the independent and voluntary sectors, is imperative.

3. Guideline recommendations
The recommendations are based on the synthesis of the best available evidence. It should, therefore, be noted that the guideline is not able to be fully reflective of the role of occupational therapy in the prevention and management of falls.

The three recommendation categories reflect key aspects of occupational therapy in the prevention and management of falls in adults.

The studies from which the recommendations were developed are outlined in the full guideline in evidence tables (Appendix 6). Recommendations are graded A (high) to D (very low) to indicate the quality of the evidence, and the scoring of 1 (strong) or 2 (conditional) indicates the strength of the recommendation – see full guideline for further details of the grading method. Twenty-four per cent of the evidence was graded as high (A), 33% as moderate (B), 39% as low (C) and 3.0% as very low (D) quality. All 15 recommendations are graded as strong.

Keeping safe at home: reducing risk of falls

**It is recommended that:**

<table>
<thead>
<tr>
<th>Recommendation</th>
<th>Grade</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Service users who have fallen or are at risk of falls should be offered an occupational therapist-led home hazard assessment, including intervention and follow-up, to optimise functional activity and safety.</td>
<td>1A</td>
</tr>
<tr>
<td>2. Occupational therapists should offer home safety assessment and modification for older people with a visual impairment.</td>
<td>1A</td>
</tr>
</tbody>
</table>
3. Occupational therapists should consider carrying out a pre- or post-discharge home assessment to reduce the risk of falls following discharge from an inpatient rehabilitation facility, taking into account the service user’s falls risk, functional ability and diagnosis.

(Di Monaco et al 2012 [B]; Di Monaco et al 2008 [B]; Johnston et al 2010 [C])

4. Occupational therapists should offer service users who are living in the community advice, instruction and information on assistive devices as part of a home hazard assessment.

(Steultjens et al 2004 [B])

Evidence overview
The evidence with respect to the effectiveness of the occupational therapist in home hazard assessments and interventions for people considered at high risk of falls (history of falling in past year, hospitalisation for a fall, severe visual impairment or functional decline) is both high quality and strong (COT 2015, p37).

Keeping active: reducing fear of falling
It is recommended that:

5. Occupational therapists should explore with service users whether fear of falling may be restricting activity, both in and outside the home, and include the promotion of occupational activity within individualised intervention plans.

(Boltz et al 2013 [C]; Kempen et al 2009 [C]; Painter et al 2012 [C]; Wijhuzen et al 2007 [C])

6. Occupational therapists should listen to an individual’s subjective views about their falls risk, alongside using objective functionally based outcomes, to determine the influence of fear of falling on the service user’s daily life.

(Schepens et al 2012 [B]; Wijhuzen et al 2007 [C])

7. Occupational therapists should seek ways of enabling service users to minimise the risk of falling when performing chosen activities, wherever possible, as this may improve confidence and enable realistic risk taking.

(Wijhuzen et al 2007 [C]; Zijlstra et al 2007 [B])

8. Occupational therapists should facilitate caregivers, family and friends to adopt a positive approach to risk.

(Boltz et al 2013 [C])

Evidence overview
The evidence on fear of falling highlights the integral link between fear and activity levels. Although reducing the number of falls may be a key outcome for falls prevention activities, the potential to restrict activity as a behavioural response to fear of falling can be to the detriment of activities of daily living and occupational engagement. People have different attitudes and levels of tolerance to risk. The occupational therapist therefore has a valuable role in working with service users, caregivers, family and friends to achieve a balance of risk and activity (COT 2015, p42).
**Falls management: making it meaningful**

*It is recommended that:*

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>9.</td>
<td>Occupational therapists should share knowledge and understanding of falls prevention and management strategies with the service user. This should provide personally relevant information and take account of the service user’s individual fall risk factors, their lifestyle and preferences.</td>
</tr>
<tr>
<td>1B</td>
<td>(Ballinger and Clemson 2006 [C]; de Groot and Fagerström 2011 [C]; Haines et al 2006 [C]; Haines et al 2004 [B]; Stern and Jayasekara 2009 [B])</td>
</tr>
<tr>
<td>10.</td>
<td>Occupational therapists should take into account the service user’s perceptions and beliefs regarding their ability, and personal motivation, which may influence participation in falls intervention.</td>
</tr>

<td>(Rosendahl et al 2008 [B])</td>
</tr>
<tr>
<td>15.</td>
<td>Activities to improve strength and balance should be incorporated into daily activities and occupations that are meaningful to the individual, to improve and encourage longer-term participation in falls prevention interventions.</td>
</tr>
<tr>
<td>1A</td>
<td>(Clemson et al 2012 [A]; Clemson et al 2010 [B]; Pritchard et al 2013 [B])</td>
</tr>
</tbody>
</table>

**Evidence overview**

Occupational therapists should maximise the engagement of the service user in falls management interventions, taking into consideration the service user’s motivation, beliefs and knowledge.

A key message to be incorporated into falls prevention and management interventions is a focus on the potential benefits to the individual of interventions to improve mobility, independence and active participation, as distinct to the language used within the professional arena of ‘reducing the incidence of falls’ or ‘decreasing the risk of falls’. Service users should be made aware of the potential implications of falling, but occupational therapists should highlight the positive outcomes rather than the negative connotations associated with falls.

Meaningful activity can be integrally linked with motivation. Physical activity which can be incorporated into daily lifestyles is more likely to be sustainable; there is a key role here for occupational therapists given this functional approach. The value of such an occupational and activity-based approach is supported by the high-quality research by Clemson and colleagues. Although the primary research for the LiFE approach was undertaken in Australia (Clemson et al 2012, Clemson et al 2010), potentially it is easily translatable to the United Kingdom (COT 2015, p48).
It is recommended that occupational therapists participate in national and local audit of falls prevention services, and use the tool which is available to support this guideline to undertake audit against the above recommendations.

Information about organisational and financial barriers that may impact on an occupational therapist’s ability to implement the recommendations are outlined in the full guideline (COT 2015, pp53-54)

4. Guideline implementation

In addition to the full guideline document, there are a number of implementation resources available to aid translation into practice, including a CPD resource and an audit tool. Some key tips to consider are outlined in the table below.

<table>
<thead>
<tr>
<th>Key tips</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Use the evidence available to inform prioritisation where there are service capacity issues which might make translation into practice more challenging.</td>
</tr>
<tr>
<td>2. Seek access to strength and balance training and/or work jointly with physiotherapy colleagues.</td>
</tr>
<tr>
<td>3. Incorporate fear of falling as a core element of assessment.</td>
</tr>
<tr>
<td>4. Be familiar with the full range of local services to expedite onward referral for further assessment, intervention or services.</td>
</tr>
<tr>
<td>5. Look for opportunities to promote the practice guideline with colleagues and multidisciplinary team members: include on the agenda of relevant meetings.</td>
</tr>
<tr>
<td>6. Present and discuss the evidence-based recommendations with colleagues – preferably with the multidisciplinary team. A Professional Development Resource PowerPoint is available with information already prepared and can be tailored for your local use.</td>
</tr>
<tr>
<td>7. Use the guideline audit tool to benchmark your service/practice and assist in identifying actions to progress implementation of recommendations. An audit tool is available to download and audit your service against the recommendations and kick-start an action plan.</td>
</tr>
<tr>
<td>8. Gather evidence of outcomes using standardised assessments and measures.</td>
</tr>
<tr>
<td>9. Use the guideline evidence and recommendations to support the case for occupational therapy as part of your business planning and commissioning activities.</td>
</tr>
<tr>
<td>10. Write an implementation case study to demonstrate how your service has translated the guideline recommendations into the workplace. Provide supporting performance/outcome data and service user feedback to demonstrate the difference you are making to service users, quality of services and cost-effectiveness.</td>
</tr>
</tbody>
</table>

The Royal College of Occupational Therapists and the Specialist Section would welcome your feedback on the guideline document and how you are using it in your practice/service. Please email RCOT Research and Development Officer Angie Thompson: angie.thompson@rcot.co.uk.

To access the implementation tools visit: https://www.rcot.co.uk/practice-resources/rcot-practice-guidelines
5. References

The full reference list for the evidence supporting the recommendations, together with the full evidence tables, can be found in the guideline.
